CURIO CABINET | 2D SHAPE MAP

Shape IDs on the drawing match the construction notes at right. The red circle is the face-opening guide.

2D layout study only: no depth, moving clearances, or hinge paths are specified here.

PART NAMES + 2D DRAWING ORDER

Build from the face frame outward; mirror the paired parts.

A — Face opening guide
Keep as a reference circle. Set its radius from the face opening, then keep the cabinet shell just inside it.

B — Curved cabinet shell
Start at the top center. Trace the circular sweep through eight compass points; shape the shoulders and lower notches with tangent curves. Mirror about the centerline.

C — Upper portrait medallion
Center on the vertical axis. Size its circle to the remaining crown space, then add a concentric ring for the frame.

D — Main circular aperture
Place a larger circle below the portrait. Add a narrow concentric rim; reserve this opening for the iris or quote window.

E — Left vertical bay
Draw a tall inset rectangle between the shell and main aperture. Align it vertically and keep a clear margin around both neighbors.

F — Right vertical bay
Mirror the left bay across the centerline, then check the gap to the shell and central opening.

G — Left crescent pocket
Follow the outer face arc and the shell's inset edge, then close the ends with short rounded curves.

H — Right crescent pocket
Mirror the left crescent pocket so both curved bays follow the same face boundary.

I — Lower-left arched bay
Set a short baseline near the bottom arc. Draw two vertical sides and finish with a semicircular crown.

J — Lower-right arched bay
Mirror the lower-left bay around the centerline; preserve equal spacing from the central plaque.

K — Lower center plaque bay
Center a horizontal rounded rectangle below the aperture and between the two arched bays.
